

## Histology Of The Tongue

Tongue • The tongue situated in the floor of the mouth, is attached by muscles to the hyoid bone, mandible, styloid processes, and pharynx. • The tongue is important in taste, mastication, swallowing, and speech. • It is composed chiefly of skeletal muscle, is partly covered by mucous membrane, and presents a tip and margin, dorsum, inferior surface, and root • The tip, or apex, usually rests against the incisors and continues on each side into the margin. • The oral part of the dorsum may show a shallow median groove.

- **Tongue**

- The tongue situated in the floor of the mouth, is attached by muscles to the hyoid bone, mandible, styloid processes, and pharynx.
- The tongue is important in taste, mastication, swallowing, and speech.
- It is composed chiefly of skeletal muscle, is partly covered by mucous membrane, and presents a tip and margin, dorsum, inferior surface, and root
- The tip, or apex, usually rests against the incisors and continues on each side into the margin.
- The oral part of the dorsum may show a shallow median groove.
